

## Autumn Hawkbit

*Scorzoneroidea autumnalis*

Looks a lot like a Dandelion! It has yellow flowers made up of narrow petals packed tightly together. The outer petals sometimes have red streaks.

## Bramble

*Rubus fruticosus* agg.

A scrambling plant with delicate white or pink flowers that turn into juicy blackberries. Its stems have small prickles, and the leaves feel hairy.

## Common Fleabane

*Pulicaria dysenterica*

Large golden yellow flowers similar to a Daisy. Its leaves are long and narrow, growing all the way up the short stem. The leaves near the top are wrinkled.

## Common Toadflax

*Linaria vulgaris*

Creamy-yellow flowers with orange centres grow in tight clusters at the top of tall, straight stems. The leaves are narrow and pointed.

## Harebell

*Campanula rotundifolia*

Thin stems with hanging, bell-shaped flowers made of papery purple-blue petals. The leaves at the top are narrow, but the leaves at the bottom are rounder.

## Honey Fungus

*Armillaria mellea*

These fungi grow in tight clusters on dead or dying wood. Their ochre-brown caps are darker in the middle and covered with tiny brown scales

## Meadow Waxcap

*Cuphophyllus pratensis*

These apricot-coloured fungi are found in grassland. Their texture is dry, unlike other slimier waxcaps. As they age, the caps flatten and may curl upwards.

## Scarlet Waxcap

*Hygrocybe coccinea*

These bright red fungi grow in groups and can be found in grassland. Their caps are domed and are always very moist, but as they age, the caps flatten.

## Tormentil

*Potentilla erecta*

This plant creeps low along the ground. It has four yellow petals and leaves that are deeply toothed with silvery undersides.

**How many of these plants and fungi can you spot?**

Tick the boxes on the pictures when you spot it.
